

GitWatch is a utility application that can be used to monitor commits on public repositories on both github and bitbucket. Users can add repositories by specifying the repository identifier which is the username/repo_name and the repository type, they can share the repository with friends and remove the repository if they want to stop monitoring, it's that simple.

Problem:

Lack of android applications that allows users to monitor commits on both bitbucket and github public repositories.

Proposed Solution:

Design an app that allows a user to add public github and bitbucket repositories, so he can monitor commits on the go. Users can add and remove repositories, they can also share the repositories as well as viewing the commit link by clicking on a commit to view a link via an Intent to the browser.
